DETAILED ACTION

Response to Amendment

1. Applicant's amendment filed on June 18, 2008 has been entered. Claims 1, 3, 5, and 7 are still pending in this application, with claims 1, 3, 5, and 7 being independent. Claims 2, 4, and 6 have been cancelled.

Allowable Subject Matter

1. Claims 1, 3, 5, and 7 are allowed.

Regarding **claims 1 and 3**, Nomura disclose a collapsible lens barrel whose lens group is retracted when an image is not captured, the collapsible lens barrel comprising a driving frame for driving the lens group, comprising a cam pin and a demating prevention pin (column 12, lines 3-10; column 15, lines 54-67; column 16, lines 1-19; Figures 1, 3-6). As the adjective "demating" carries no structure with it, it carries no weight to the limitation. The pin structure (18 and 19a) in the reference serve a dual function as both cam pins and demating prevention pins. As there is a plurality of said pin structures, there exists at least one of both a cam pin and a demating prevention pin.

Further, Nomura et al disclose a cam frame comprising a cam groove and a demating prevention groove that mate with the cam pin and the demating prevention pin, respectively (column 12, lines 7-10; column 15, lines 54-58). The same reasoning

that applies to the distinction between cam pins and demating prevention pins above applies to cam grooves and demating prevention grooves as well.

Further, Nomura et al disclose a first protrusion and a second protrusion on at least one side in an optical axis direction of a portion of the demating prevention groove with which the demating prevention pin mates (Figure 3, element 17e).

However, Nomura et al does not disclose that the demating prevention pin contacts the protrusion when the driving frame is advanced. Rather, Nomura et al allows for the demating prevention pin to contact the protrusion when the driving frame is retracted.

Regarding **claim 5 and 7**, a collapsible lens barrel whose lens group is retracted when an image is not captured, the collapsible lens barrel comprising a driving frame for driving the lens group, comprising a cam pin (column 12, lines 3-10; column 15, lines 54-67; column 16, lines 1-19; Figures 1, 3-6). Further, Nomura et al disclose a cam frame comprising a cam groove and that mates with the cam pin (column 12, lines 7-10; column 15, lines 54-58). .

Further, Nomura et al disclose a first and second protrusion with which the cam pin mates when the driving frame is retracted (Figure 3, element 17e); wherein, in a state where the lens group has been retracted, the cam pin contacts the protrusion to prevent the cam pin from demating from the cam groove (column 15, lines 66-67; column 16, lines 1-9).

However, Nomura et al do not disclose that the protrusion is provided on at least an object side in an optical axis direction of a portion of the cam groove. Rather,

Nomura et al disclose that the protrusion is provided on at least an image sensor side in an optical axis direction of a portion of the cam groove.
